Why study Rare diseases ?

Lynne A. Wolfe, CRNP

NIH-Undiagnosed Diseases Program Site Coordinator, NHGRI

Gold Rare Disease Symposium May 2019

National Human Genome Research Institute

The Forefront of Genomics®

Prevalence of Rare Disease

US definition:

- Fewer than 200,000 people (about 1/1,575)

European definition:

- Rarer than 1 in 2,000 individuals

Prevalence of some single-gene disorders[*citation needed*]

Disorder prevalence (approximate)	
Autosomal dominant	
Familial hypercholesterolemia	1 in 500
Polycystic kidney disease	1 in 1250
Neurofibromatosis type I	1 in 2,500
Hereditary spherocytosis	1 in 5,000
Marfan syndrome	1 in 4,000[2]
Huntington's disease	1 in 15,000[3]
Autosomal recessives	
Sickle cell anaemia	1 in 625
Cystic fibrosis	1 in 2,000
Tay–Sachs disease	1 in 3,000
Phenylketonuria	1 in 12,000
Mucopolysaccharidoses	1 in 25,000
Lysosomal acid lipase deficiency	1 in 40,000
Glycogen storage diseases	1 in 50,000
Galactosemia	1 in 57,000
X-linked	
Duchenne muscular dystrophy	1 in 7,000
Hemophilia	1 in 10,000
Values are for liveborn infants	

https://en.wikipedia.org/wiki/Genetic_disorder

NIH NHGRI

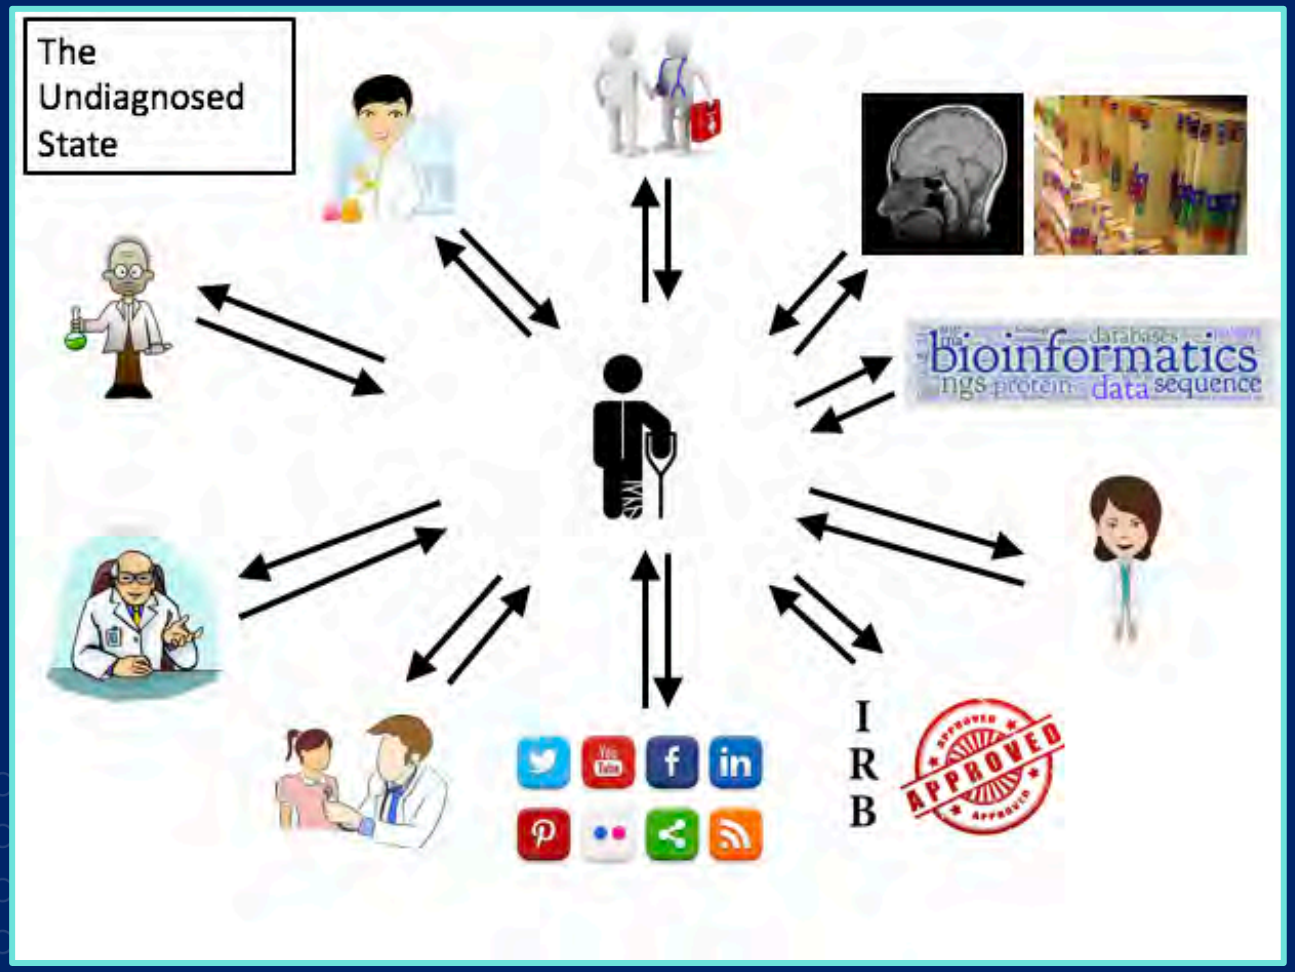
Rare Diseases are Common as a Group

- Using the US definition, 1 in 10 US citizens have a rare disease
- Most are genetic
- Many remain undiagnosed for many years
- New rare diseases continue to be discovered & may be characterized

https://www.who.int/genomics/public/geneticdiseases/en/index2.html

NIH
NHGRI

Living with an Undiagnosed/Rare Disease



Living with an undiagnosed or rare disease is complex with many stakeholders and yet it is very isolating for the person/family experiencing it

NIH
NHGRI

Importance of studying Rare diseases

- What do I/my child have?
  - Diagnosis
  - Closure
- Why did it happen?
  - Genetic basis
  - Pathogenesis/Mechanism of disease/Cell biology
- What will happen now?
  - Prognosis
  - Natural History
- Is there a treatment?
  - Not always to cure the disorder but can improve quality of life
- Will it happen to other family members?
  - Recurrence risk for a young family
  - Genetic counseling for childbearing siblings and other family members

NIH
NHGRI

Diagnosis/Closure

NIH
NHGRI

UDP 5185

- Upgaze palsy
- Optic nerve atrophy
- Cerebellar atrophy
- Truncal Hypotonia
- Axonal Neuropathy
- Losing skills

Older sibling not affected, not a carrier

Referred to Disease Expert for further research

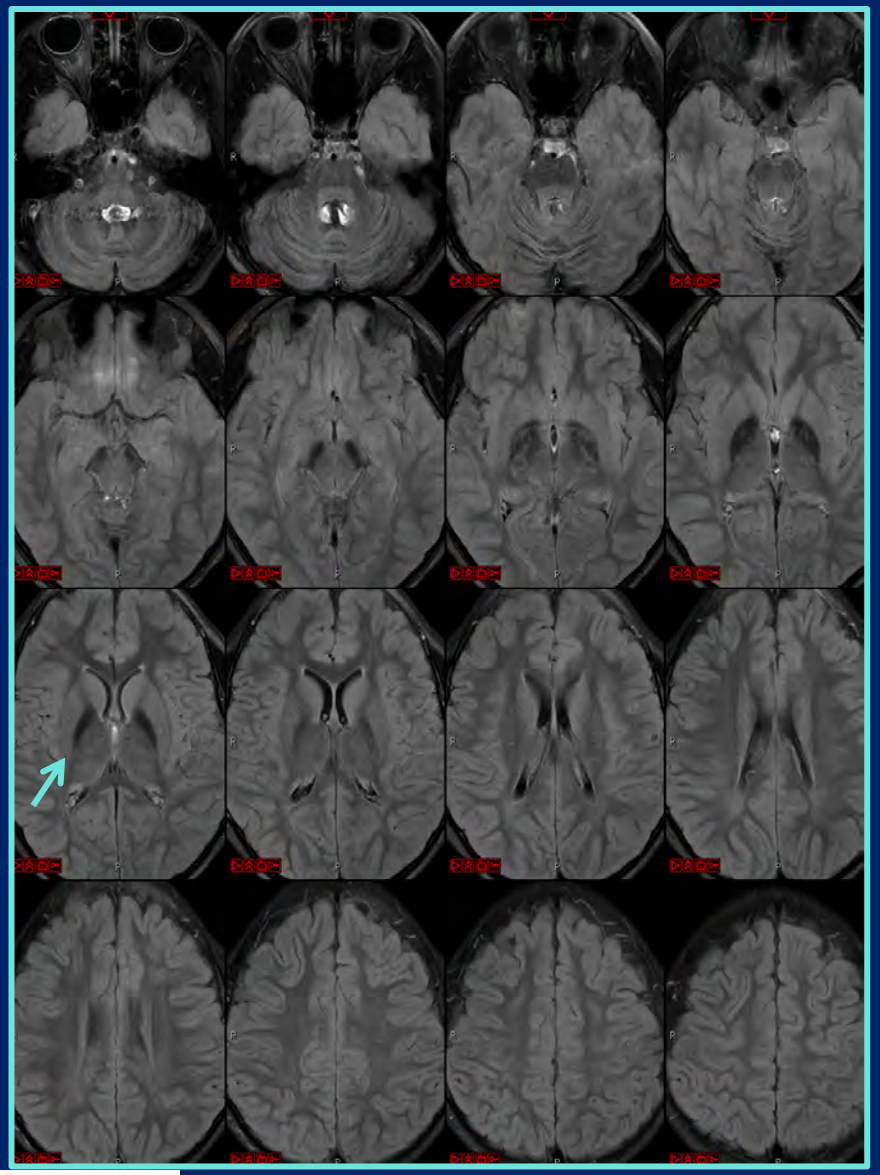
NIH NHGRI

UDP 5185

Brain MRI

Iron accumulation in the globus pallidus

Neurodegeneration Brain Iron Accumulation (NBIA) due to *PLA2G6* Duplication exons 4-7 c.426?_1077+[2] (known) and c.950G>T (p.Gly317Val) (novel)



Disruption of Golgi morphology and altered protein glycosylation in PLA2G6-associated neurodegeneration

Mariska Davids,[1,2] Megan S Kane,[1,2] Miao He,[3,4] Lynne A Wolfe,[1,2] Xueli Li,[3,4] Mohd A Raihan,[3,4] Katherine R Chao,[1,2] William P Bone,[1,2] Cornelius F Boerkoel,[1,2] William A Gahl,[1,2] Camilo Toro[1,2]

NIH NHGRI

Neurodegeneration Brain Iron Accumulation (NBIA) aka *Infantile* Neuroaxonal Dystrophy

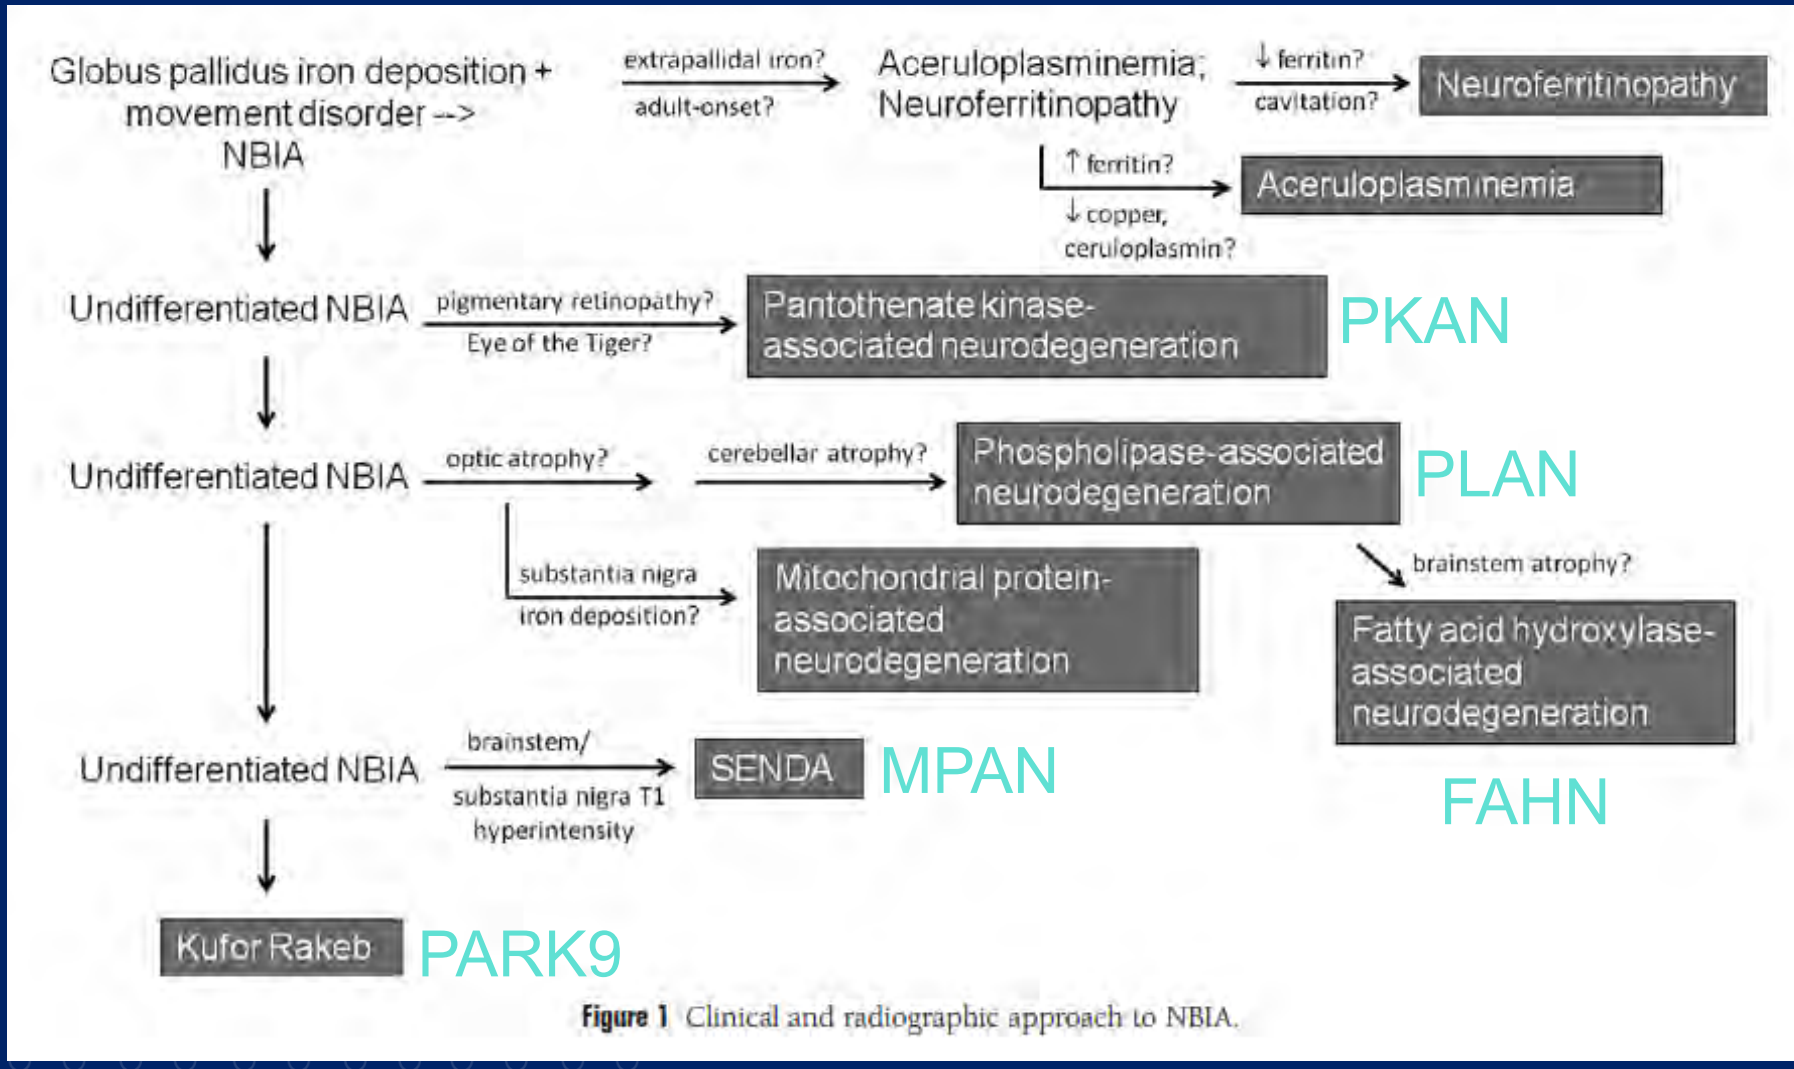

Figure 1 Clinical and radiographic approach to NBIA.

Semin Pediatr Neurol 19:67-74 2012

NIH NHGRI

UDP 5433, 5434, 5736

- Below 3rd centile on all growth parameters
- Nystagmus, ptosis, cataract with probable retinal degeneration
- Declining cognitive function with age
- Resting tremor
- Scoliosis
- Ataxic gait with demyelinating peripheral neuropathy
- General weakness & easy fatigue

ERCC6 c.2008C>T (p.R670W); and c.208C>T (p.R70W)
Cockayne Syndrome is one of three known Nucleotide Excision Repair disorders & causes premature aging

NIH
NHGRI

Vineland Adaptive Behavior Scales II

Youngest sibling not affected, not a carrier

	VT	LT	TT	ST
Chronological Age	2 years	5 years	7 years, 1 month	8 years, 10 months
Communication	101	85	88	81
Receptive Age Equivalent	2 years, 2 months	2 years, 6 months	4 years, 7 months	3 years, 11 months
Expressive Age Equivalent	2 years, 3 months	3 years, 6 months	8 years	7 years
Daily Living	105	91	76	71
Socialization	112	105	83	76
Motor	96	91	70	75
Gross Motor Age Equivalent	2 years, 3 months	3 years, 5 months	2 years, 4 months	2 years, 9 months
Fine Motor Age Equivalent	1 year, 10 months	5 years, 1 month	5 years, 7 months	5 years, 10 months
Adaptive Behavior Composite	104	91	80	74

NIH NHGRI

New Mechanism of Disease

NIH
NHGRI

COG4 Saul Wilson Syndrome

First described in 1982, gene identified 2018

NIH
NHGRI

COG4 Saul Wilson Syndrome

- Growth
  - Intrauterine growth retardation
  - Delayed growth & severe short stature
- Dysmorphic Facial features
  - Prominent forehead early > tall forehead with age
  - Prominent veins
- Ophthalmologic
  - Congenital Cataracts
  - Retinal Pigmentary changes
- Combined sensori-neuro & conductive hearing loss
- Immunological
  - Congenital Neutropenia
  - Frequent ear & respiratory infections
- Skeletal
  - Congenital Club feet
  - Unique Skeletal dysplasia with Odontoid hypoplasia
  - Severe progressive osteoporosis requiring joint replacements

NIH
NHGRI

COG4 Saul Wilson Syndrome

Short fingers especially the finger tips

Severe Club feet even after casting and/or corrective surgery

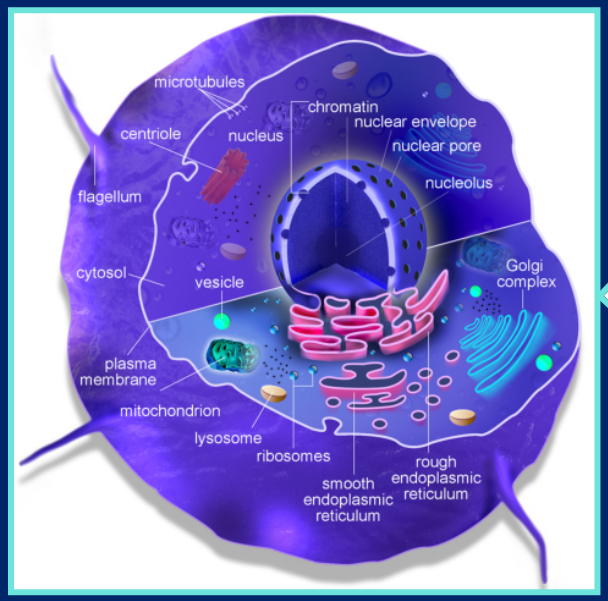
NIH
NHGRI

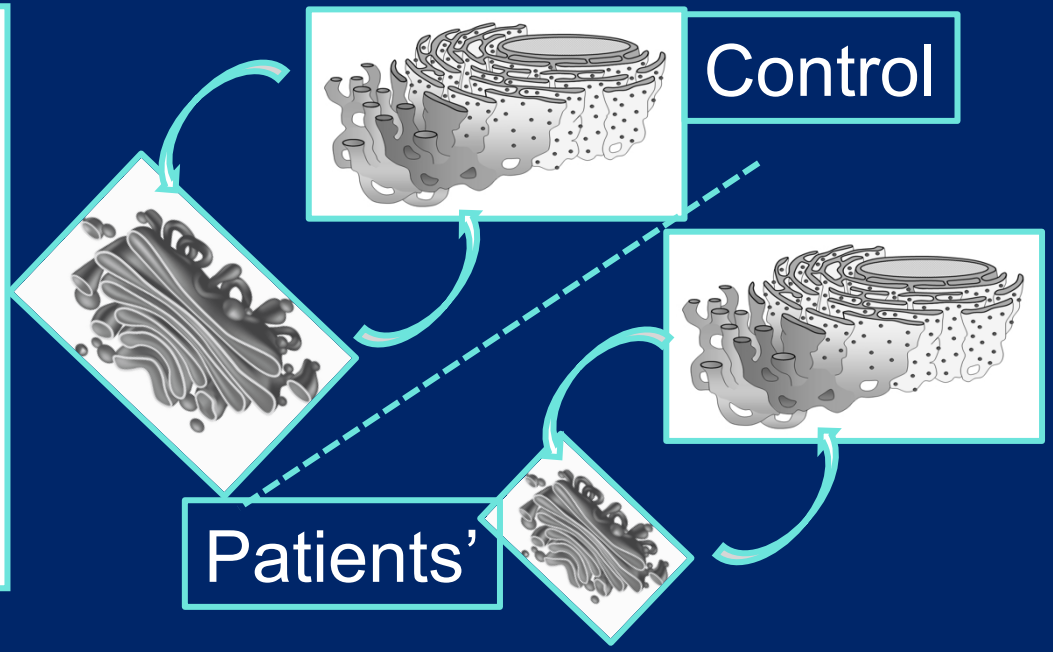
COG4 Saul Wilson Syndrome

A Recurrent *De Novo* Heterozygous COG4 Substitution Leads to Saul-Wilson Syndrome, Disrupted Vesicular Trafficking, and Altered Proteoglycan Glycosylation

The American Journal of Human Genetics *103*, 553–567, October 4, 2018

COG4 p.Gly516Arg





NIH NHGRI

Is there a treatment ?

NIH
NHGRI

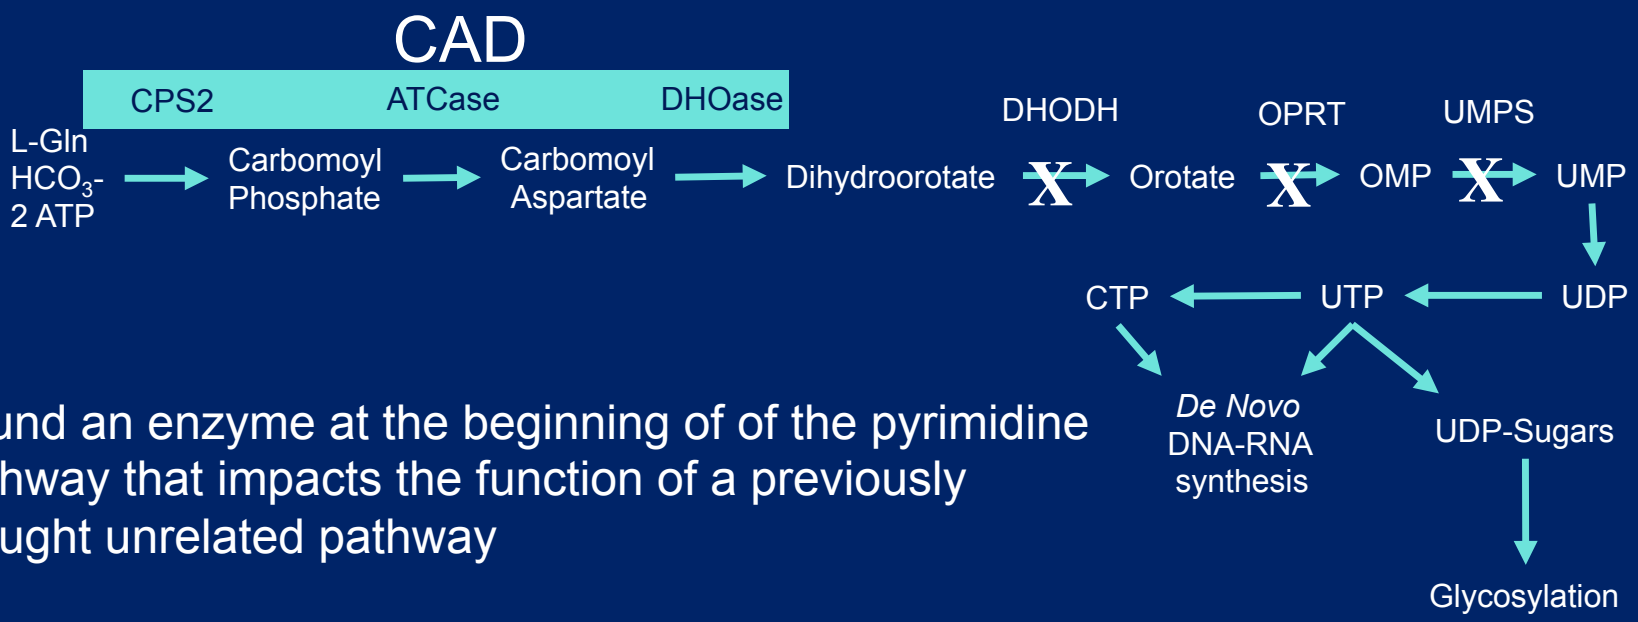
UDP 4003

- Seizures
- Mild delays in fine motor & speech
- Chronic anemia
- Splenomegaly
- Mild sensory neuropathy

CAD c.1843-1G>A; c.6071G>A (p.R2024Q) both novel
25% recurrence risk

NIH
NHGRI

UDP 4003



Found an enzyme at the beginning of of the pyrimidine pathway that impacts the function of a previously thought unrelated pathway

Treatable with Xuriden (Triacetyluridine)

Biallelic mutations in CAD, impair de novo pyrimidine Biosynthesis and decrease glycosylation precursors

Bobby G. Ng[1†], Lynne A. Wolfe[2,†], Mie Ichikawa[1], Thomas Markello[2], Miao He[4], Cynthia J. Tifft[2,3], William A. Gahl[2,3] and Hudson H. Freeze[1,*]
Human Molecular Genetics, 2015, Vol. 24, No. 11

NIH NHGRI

Importance of Identifying Rare diseases

- Discovering new diseases generally leads to more cases being identified, better characterization of the spectrum of disease, and the possibility of treatments (even for common diseases) however this means a lot of data needs to be obtained and then shared

NIH
NHGRI

Challenges of Data Sharing

- Patient privacy
- Time associated collecting & reviewing relevant data in the academic or research setting
- Academic credit, intellectual property
- Structured file conventions and sizes
- Applicable laws
- Language and basic science translation

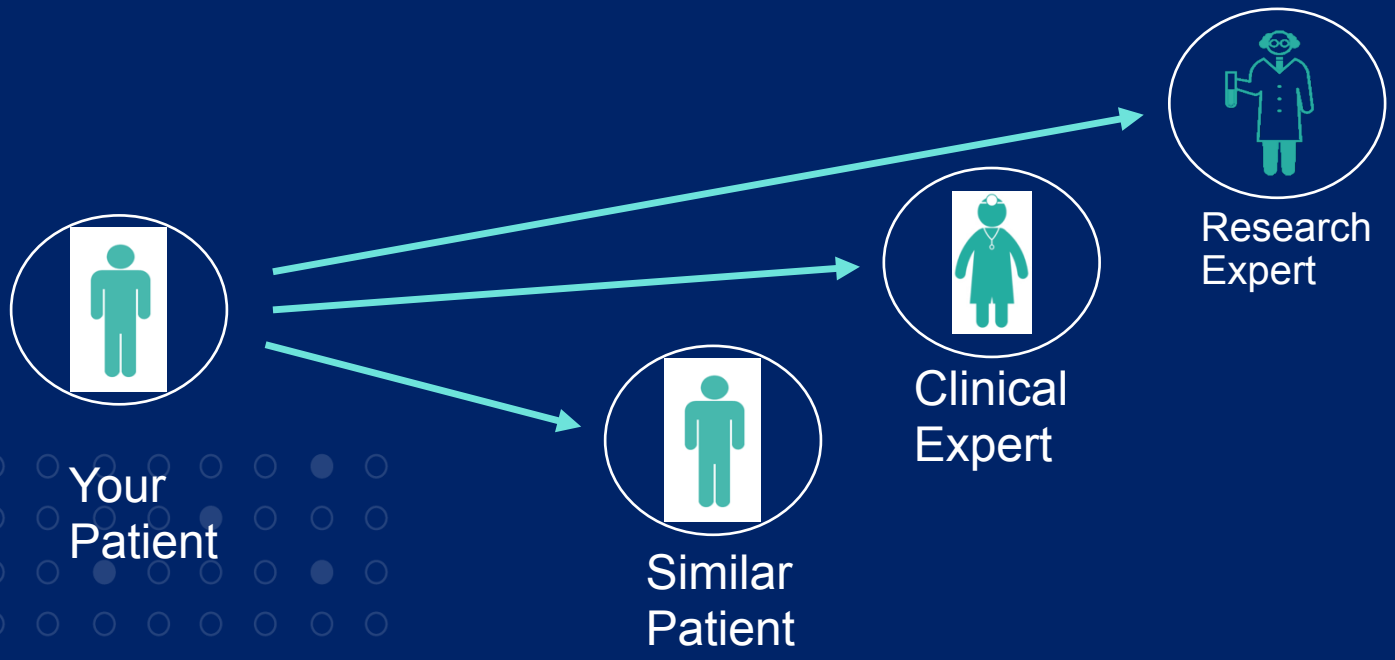
NIH
NHGRI

Data Sharing Tools

NIH
NHGRI

Goals of Data Sharing

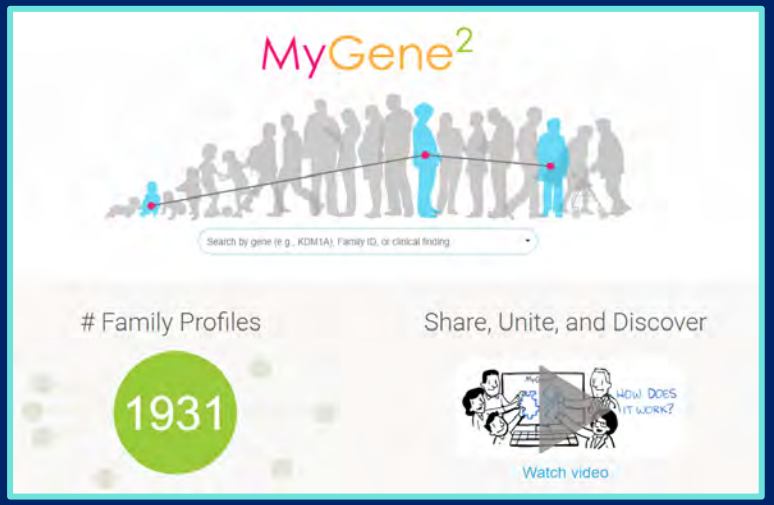
- Identify additional cases to build cohorts for research and establish communities for families
- Identify clinical and research experts to explore disease-causation hypotheses

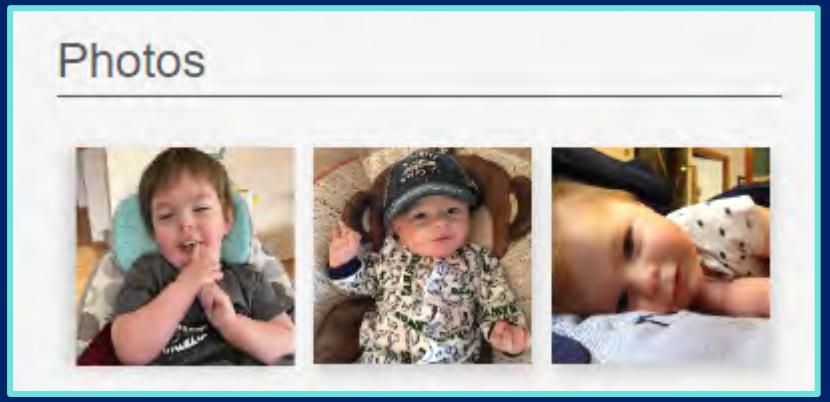


NIH NHGRI

Open Data Sharing

- Person with illness has full access to data and can edit data
- Any data contributors can view all cases and contact other participants
- Family can add data that shows identity of person with illness
- Example: MyGene^2



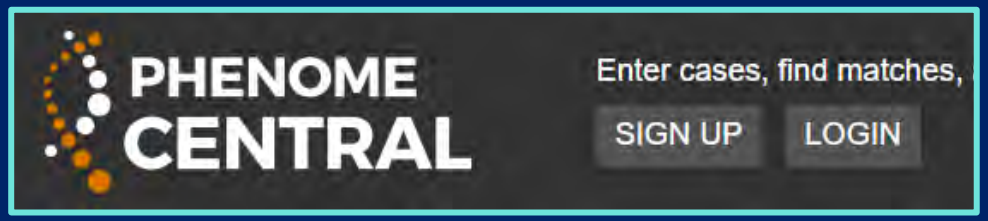


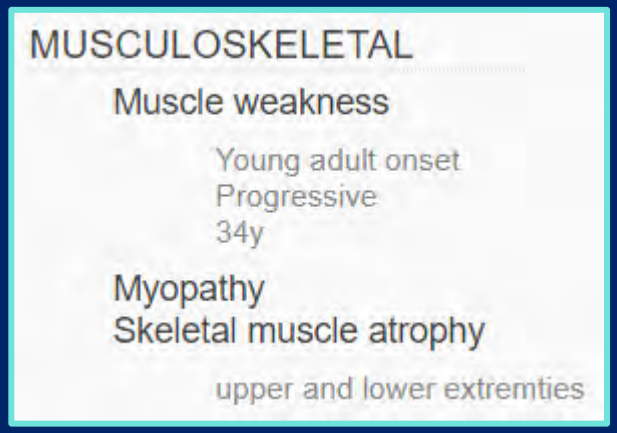
Candidate Variant ID	Het group	Gene	Inheritance	Chr:Position	Alleles
3013	30133014	ALG14	autosomal recessive (compoun...	chr1:95530570	C>A
3014	30133014	ALG14	autosomal recessive (compoun...	chr1:95448759	A>T
3017		NRSN1	unknown / other	chr6:24146136	T>C

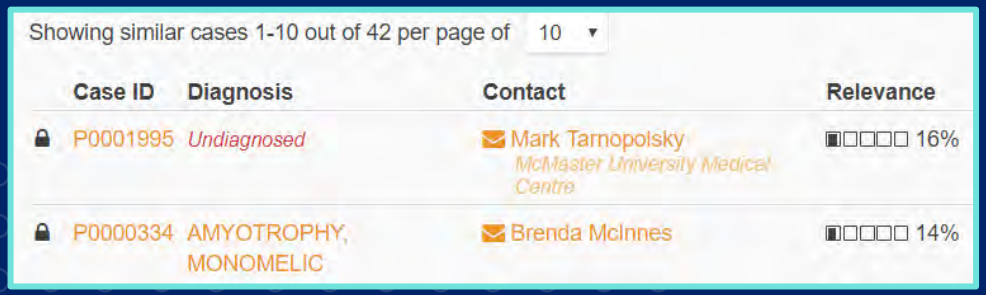
https://mygene2.org/MyGene2/

NIH NHGRI

Closed Data Sharing Spectrum







https://www.phenomecentral.org/

- Submissions only edited by the submitter
- May share limited information
  - Only gene name
  - Human Phenotype Ontology (HPO) terms to describe illness
- Does not include information about patient's identity
- Site allows user to control access to submissions
- Example: PhenomeCentral

NIH NHGRI

Human Phenotype Ontology

- A standardized language for describing clinical signs and symptoms
- HPO terms arranged as a graph from less specific to more specific
- Allows computational comparison of cases

Less Specific

More Specific

HP:0000240
Abnormality of Skull Size

HP:0040195
Decreased Head Circumference

HP:0000252
Microcephaly

HP:0011541
Congenital Microcephaly

HP:0000253
Progressive Microcephaly

HP:0005484
Postnatal Microcephaly
